

Group 2 GameSite

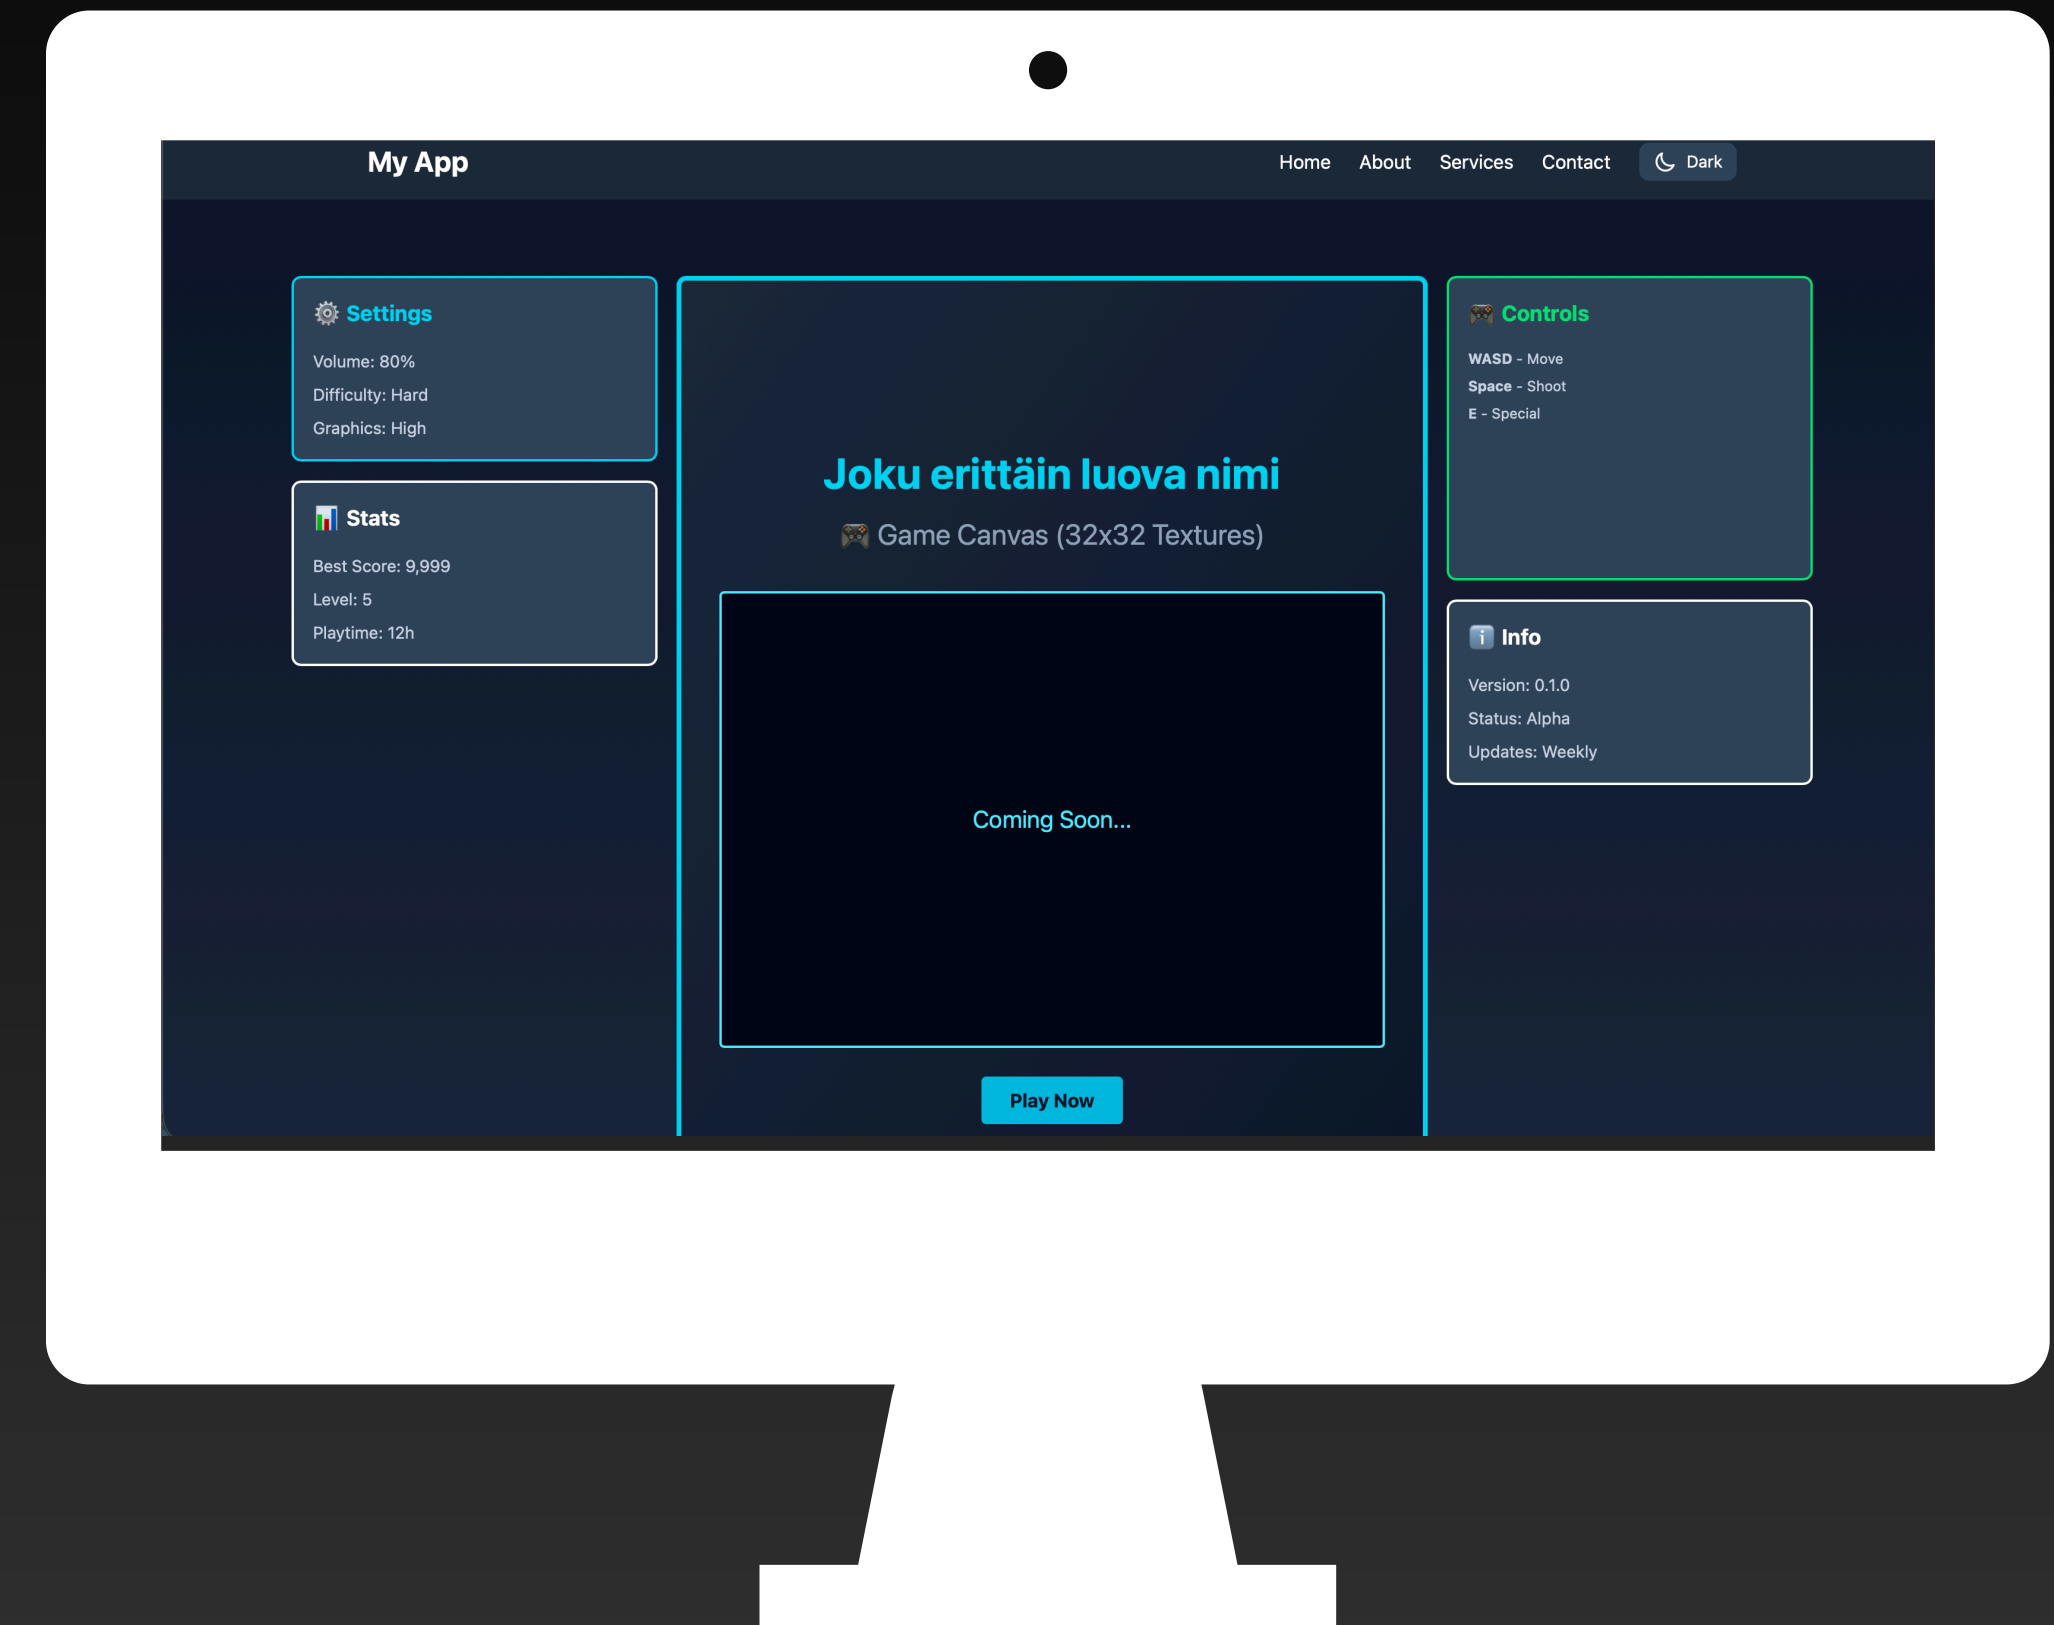

Sprint 2 Presentation

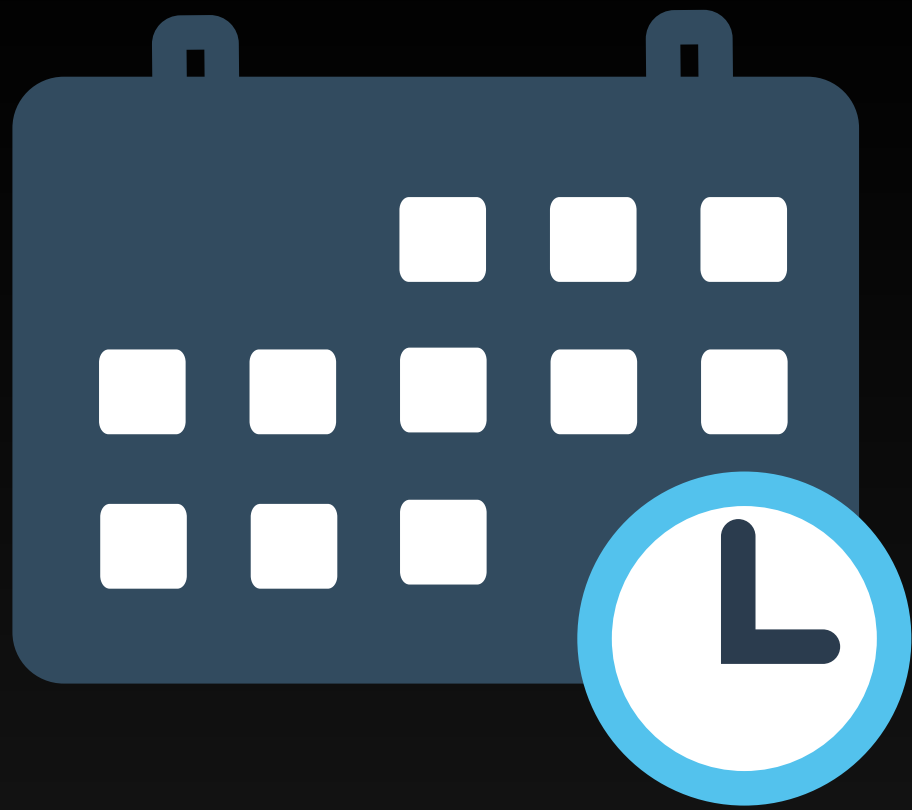

Sprint 1 Recap

Prototype

- Simple show of what a game page would look like.
- Basically everything non-functional, page-links take you nowhere, even the page name is a placeholder.
- Objects aren't in components, except the header.

Sprint 2 Goals

What were the objectives for Sprint 2?

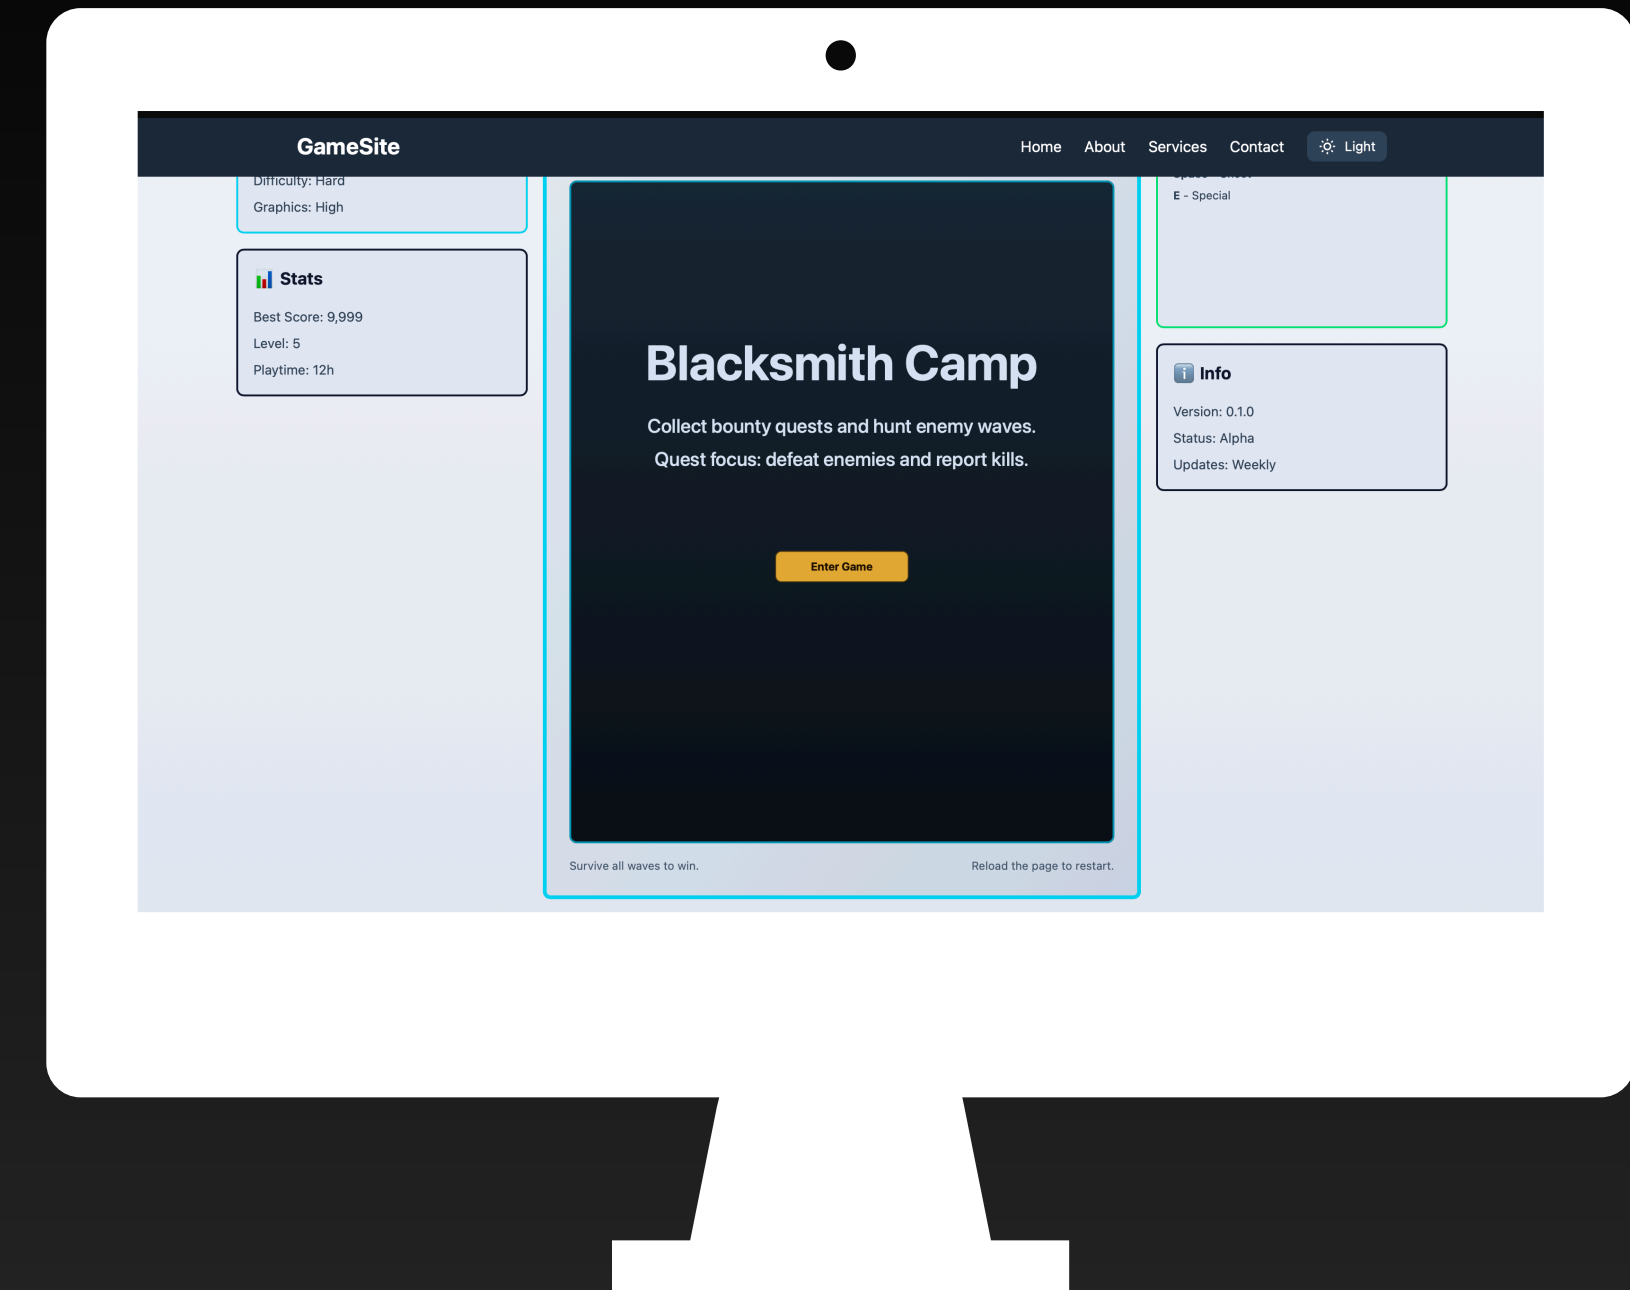

- One of the most important goals, were to make our front-end functional instead of a “static” page, including putting everything in their respective components.
- On the back-end, our goal was to get a simple database started as well as a single game that can be made functional in the front-end.
- Simple artificial intelligence features.

Front-End Progress

What's been done?

- Header is now “sticky”, so it follows when you scroll the page.
- Web page follows system theme, so the site is on white theme if your system is too and vice versa.
- Game has been brought to the front-end and is functional.
- Website name isn't just “My App” anymore, the website now shows GameSite as the name.

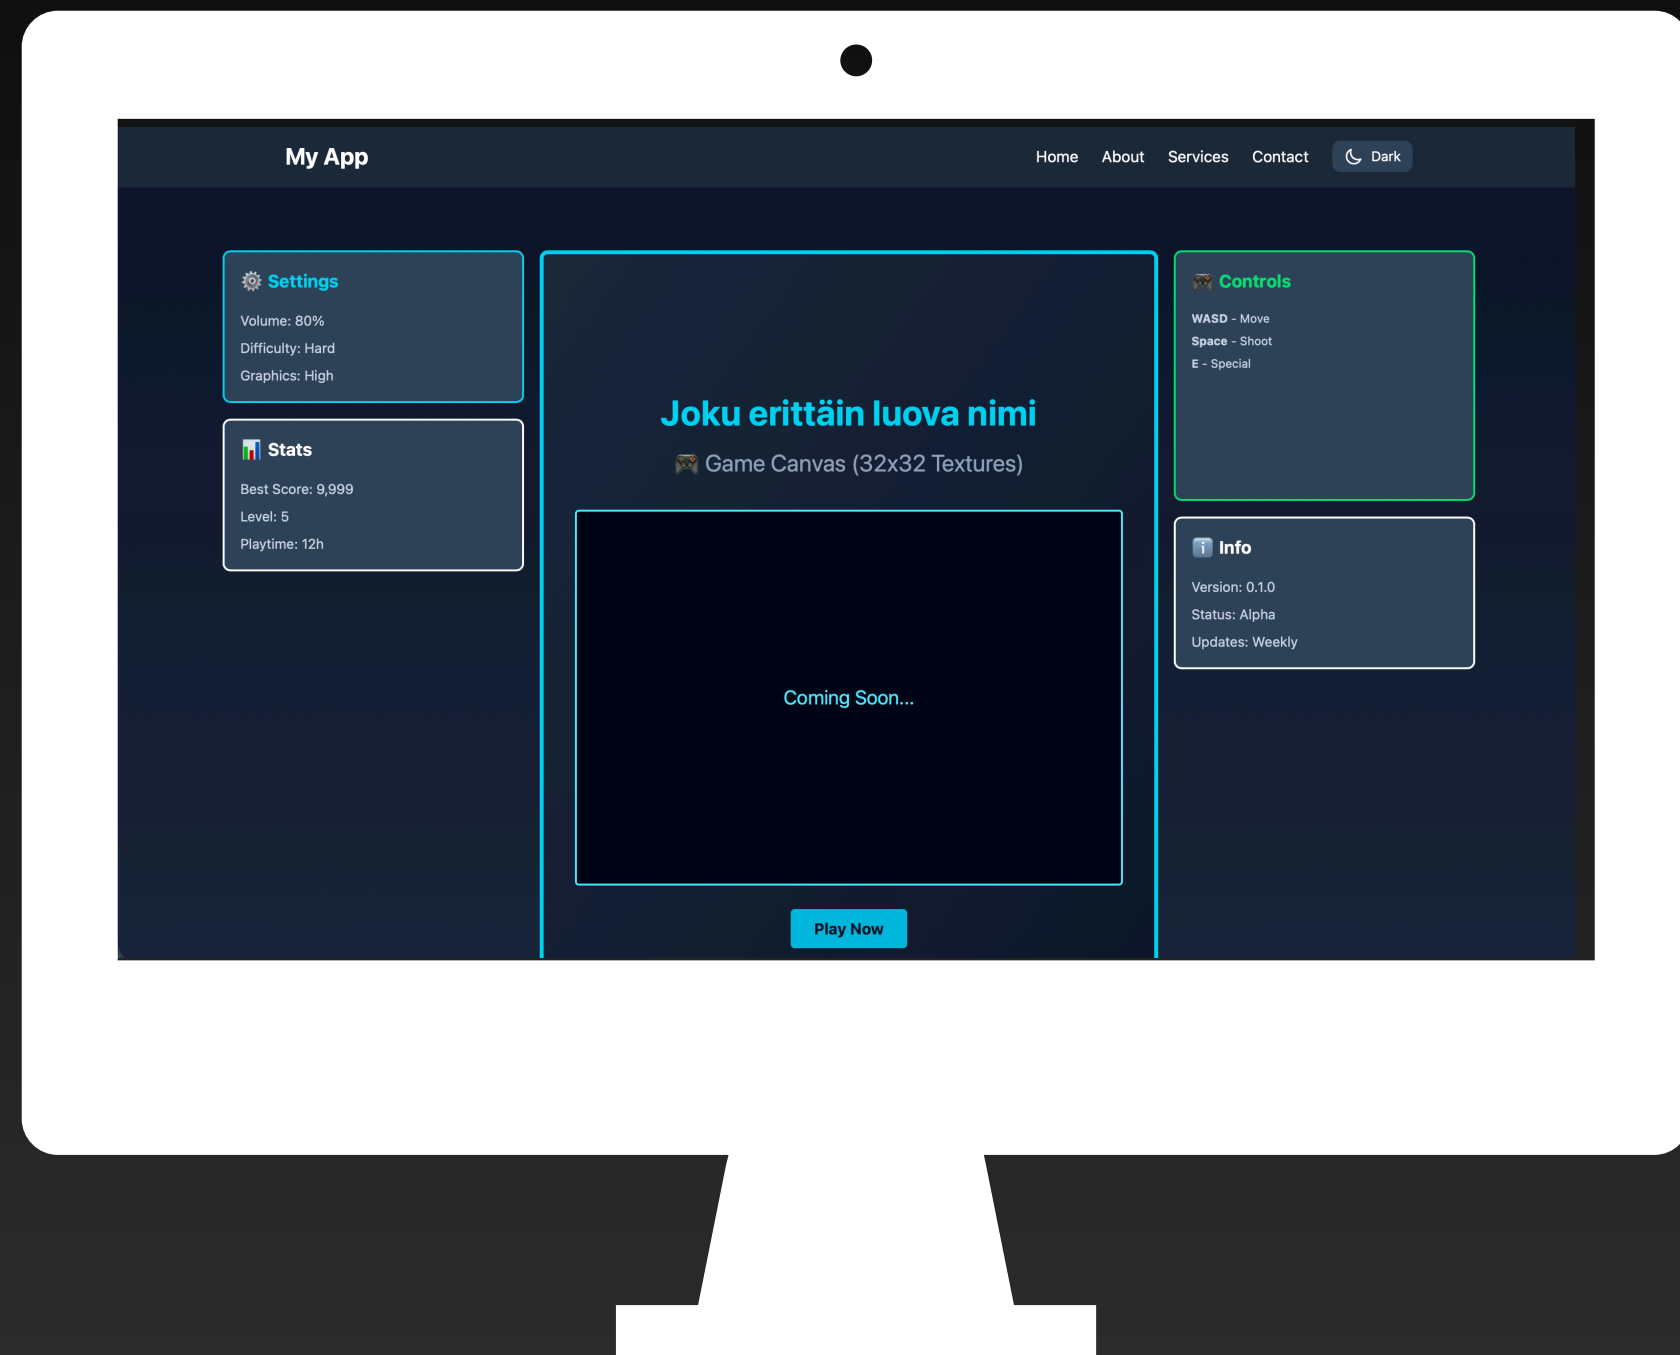

Back-End Progress

How's the back-end side of things?

- Game has support for ollama hosted LLM's for fancier questing
- MongoDB database started
- Basic files for communicating with the database created
- Basic structure for the back-end built

Alignment with Sprint 1 Prototype

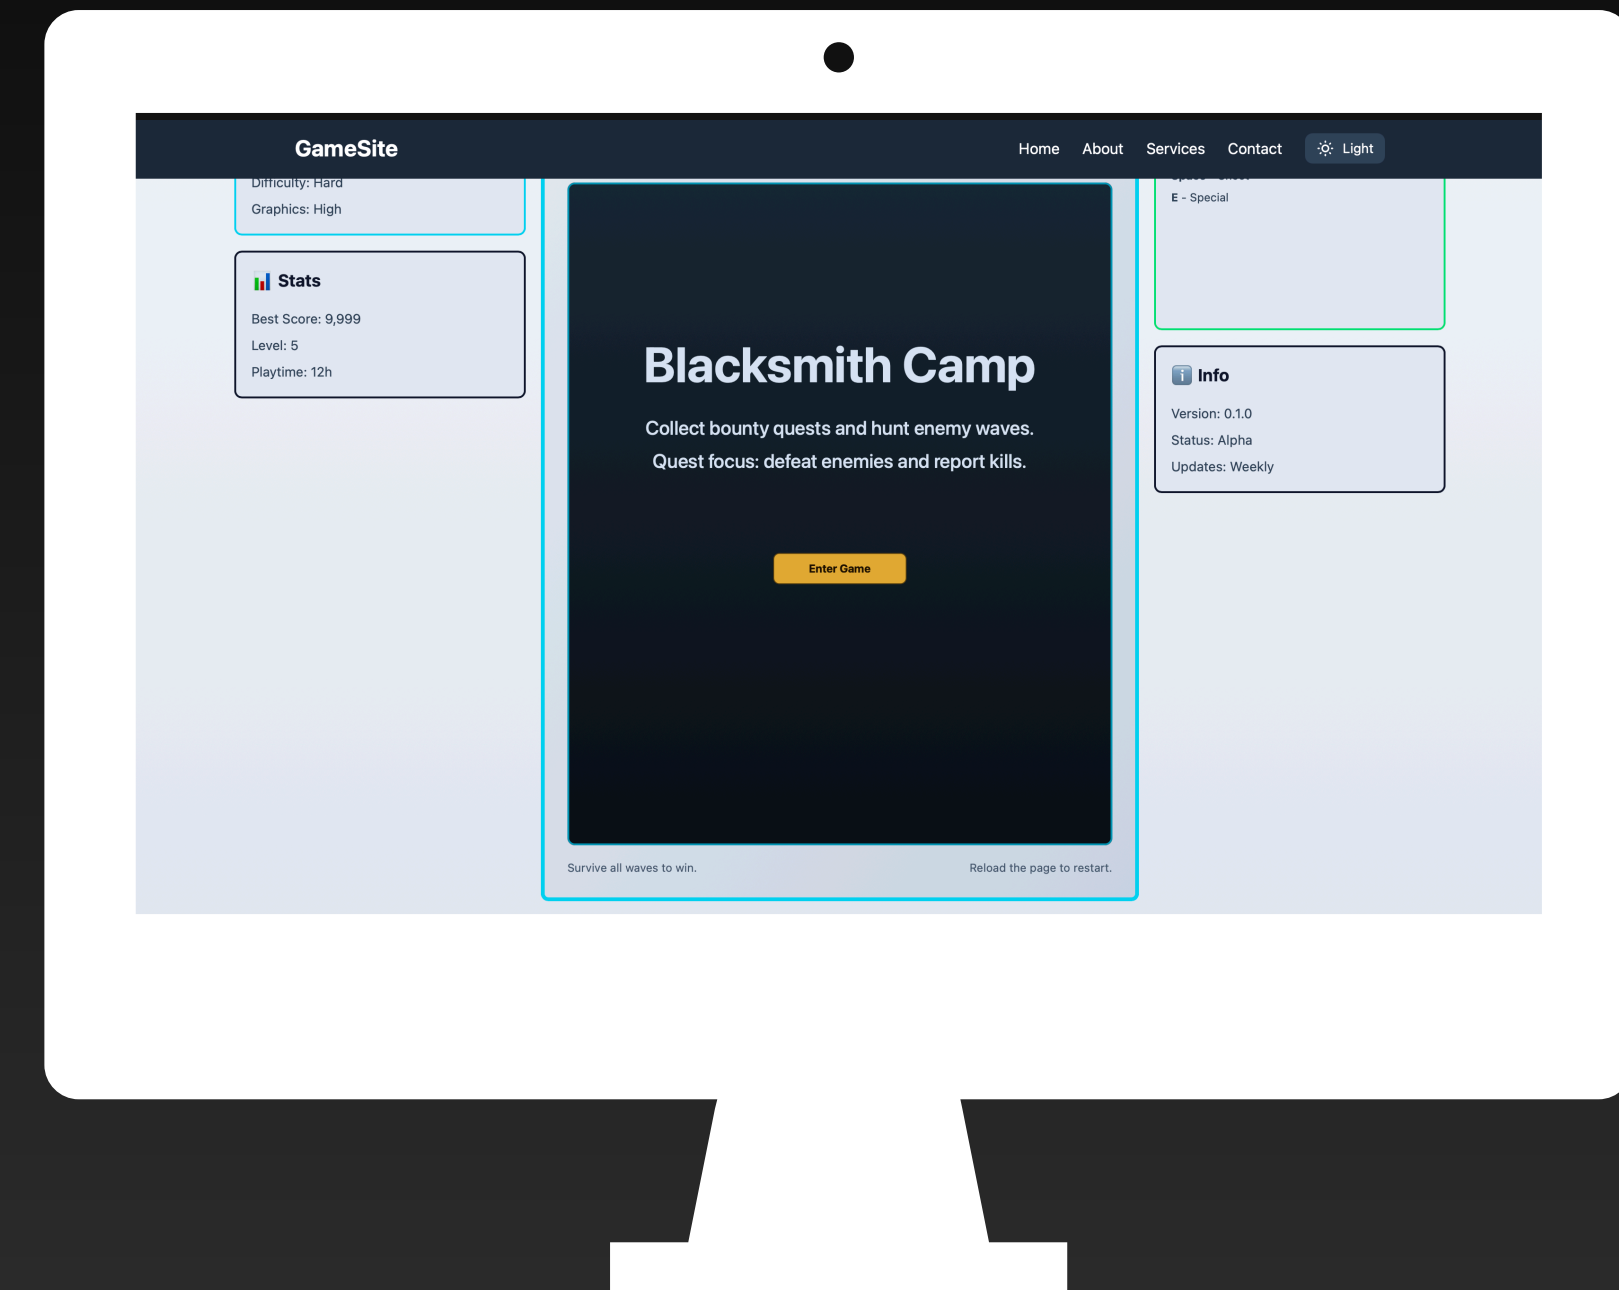

Side by side comparison of our progress

Old

Main changes include:

- Page not just static anymore
- Light- dark themes that follow system
- Functional game
- Sticky header
- Page made by different components

New

Sprint Ceremony Insights

How did we do?

- Better communication than last time, but still needs work.
- Light Scrums, not daily, not extensive, but happened.
- Retrospective:
 - Work was fun
 - Learned practical solutions
 - Lacked some communication
 - Longed for more time

Remaining Tasks and Next Sprint

What didn't we do?

- Front-end needs a proper home-page still, so that will be a key point in the next sprint.
- Back-end will need to be properly made and connected to the front-end for the game-page to work with more than a single game.
- Proper AI integration

Team Contributions

Who did what?

Member	Key Contributions
Micael Raste	Put elements into components, built header, built theme functionality
Severi Kerkkä	Created the game and added local LLM support
Ville Valtasalo	Made MongoDB database, created basic back-end and database commands, researched game development

Thank You

Summary

- Front-end in a much nicer shape
- Game functionality works
- Everyone did a great job
